Java Take Home Coding Assignment

The Task

Create a **production ready** web service which combines two existing web services.

Requirements:

1. Web service should combine a random name and random joke and return them to a web client
2. Random names should come from http://uinames.com/api/
3. Random jokes should come from http://api.icndb.com/jokes/random?firstName=John&lastName=Doe&limitTo=[nerdy]

TIME GUIDELINES

We recommend you spend at least 2 to 4 hours on this task.
You should aim to at least have running code which meets the basic requirements of the task.

Production ready is a broad goal: if you're unable to fully meet it then please include clear TODO comments in your code that are sufficiently detailed that another engineer could complete the task without having to do additional design thinking and the result would match your vision of production readiness.

Please let us know how much time you spent on the task when you submit your answer.

FURTHER REQUIREMENTS

The web service should be written in **Java.**

Write a README.md file which (at a minimum) provides instructions for running the web service and how to connect/receive a response as a client.

The web service should remain responsive under load and be able to support multiple concurrent requests.
The code, README.md and any other supporting files should be compressed into a single archive and submitted for review by email.

Example

FETCHING A NAME

$ curl http://uinames.com/api/
{"name":"Δαμέας","surname":"Γιάνναρης","gender":"male","region":"Greece"}

FETCHING A JOKE

$ curl 'http://api.icndb.com/jokes/random?firstName=John&lastName=Doe&limitTo=\[nerdy\]'
{ "type": "success", "value": { "id": 181, "joke": "John Doe's OSI network model has only one layer - Physical.", "categories": [“nerdy”] } }

USING THE NEW WEB SERVICE

$ curl ‘http://localhost:5000’
Δαμέας Γιάνναρης’s OSI network model has only one layer - Physical..
